WUNDRO

SAY IT. SEE IT.
Voice-powered augmented reality

THE IDEA

What if you could talk to your surroundings?

Wundro turns everyday speech into changes in your real environment. Ask for furniture, preview it through your phone camera, place it, and keep refining it through conversation. The world even talks back. No complicated 3D editor or rigid voice commands required.

HOW IT WORKS

01 Gnani Prisma Transcribes English and Indian-language speech, including Hindi, Hinglish and Marathi.

02 Cohere Interprets the request and scene context, then plans supported object actions.

03 Wundro AR engine Discovers available 3D models and executes validated placement or editing actions in WebXR.

04 Gnani Timbre Synthesizes a contextual spoken reply, played back on the phone.

WHAT YOU CAN DO

- Ask for a sofa, table or lamp; retrieve and preview a real 3D asset.
- Place, move, scale, rotate or recolor objects through natural instructions.
- Continue conversations with references like “make it smaller” or “put it here.”
- Switch between English, Hindi/Hinglish and Marathi; hear spoken feedback.

WHY IT STANDS OUT

Wundro goes beyond transcription: speech produces visible, persistent changes in a 3D scene. Its contextual, multi-turn workflow joins practical try-before-you-buy visualization with a playful AR sandbox.

Actual prototype capture: a voice-requested sofa placed in AR.

BUILT WITH Gnani Prisma + Timbre • Cohere • Three.js / WebXR • FastAPI • Vite

PROTOTYPE SCOPE 3D objects are retrieved from compatible asset libraries; spatial placement uses AR hit-tests or estimated aiming. This is not unrestricted 3D generation.
